

Hi Hiring Team,

I'm a full-stack developer with over two years of hands-on experience building scalable tools using Node.js and Next.js, with a strong emphasis on backend development and Linux server automation.

In my current role, I built a custom server automation platform using Node.js, Next.js, Socket.IO, and shell scripting. It streamlines domain setup, DNS configuration, project deployment, backups, and real-time monitoring. The system integrates with Nginx, Apache, and Virtualmin, helping our team cut down manual server management time by more than 70%.

On the frontend, I design clean, user-friendly dashboards with Next.js and Tailwind CSS that make backend operations easier to manage—for example, displaying deployment statuses in a way that's clear and actionable.

Outside of building features, I write CI/CD scripts, manage deployments via SSH, and automate repetitive workflows—one of which reduced a 45-minute task to just 12 seconds.

I'm looking to contribute to a team solving real infrastructure and automation challenges, where performance and reliability truly matter. I'd love the chance to bring my experience and mindset to your engineering team.

**Best regards,
Mahesh Bhatiya**
